

Qazen.AI

Test smarter. Ship faster.

An AI-native test management platform that turns user stories into passing tests — automatically. Qazen unifies the entire QA lifecycle: test case generation, browser automation, and bug tracking in one workflow.

— THE PROBLEM

Time-Consuming

Writing test cases manually takes hours per feature. QA can't keep up with development pace.

Bugs Slip Through

Inconsistent coverage leads to production incidents. Bug reports lack context and reproducibility.

Fragmented Tools

Teams juggle spreadsheets, runners and trackers — no unified workflow, no AI assistance.

— PLATFORM FEATURES

01 — AI Test Generation

Full suite in seconds

Point the AI at any URL → Playwright extracts the UI → Claude generates structured test cases with Python scripts.

02 — Instant Test Healing

AI fixes broken scripts

Hit Heal when a script breaks — the AI auto-resolves syntax errors, imports, and logic issues.

03 — Run Tests Online

No local setup

Execute manual or automated runs in the browser. Ephemeral containers, zero DevOps configuration.

04 — Auto Bug Creation

Zero slip-throughs

Failed tests open bug tickets on the scrum board automatically — with logs, screenshots, and context.

05 — All-in-One Board

Project + test management

Board, tickets, tests and runs under one roof — no context switching between tools.

06 — Real-Time Sync

WebSocket-powered

Ticket moves, comments and test results appear the moment they happen — no refresh needed.

07 — Team Collaboration

Roles & invites

Up to 20 members per project. Assign 5 role types: Owner, QA, Dev, PO, Designer.

08 — Easy Reports

One-click PDF export

Pass rates, run history, and status breakdowns — exportable for stakeholder sharing.

— ARCHITECTURE

Modern monorepo: Next.js 16 / React 19 with Tailwind v4 and shadcn/ui on the frontend. FastAPI 0.115 with SQLAlchemy, Anthropic Claude SDK and Socket.IO on the backend. Docker Compose deployment with ephemeral Playwright test containers and a credits system with scheduled renewal.
